

THE ECONOMIC & CONSUMER BENEFITS FROM **5G**

If State and Local Governments Streamline Costly Red Tape

SUMMARY

Fueled by growth in the number of connected devices and the increased need for more bandwidth, wireless companies are planning to invest in 5th Generation (5G) wireless technology. However, meeting that accelerated pace of consumer demand for wireless communications services will require service providers to make massive upgrades to the current mobile service infrastructure. This upgrade, expected to provide consumers speeds that are at least ten times faster than the current 4G standard, promises to bring significant benefits to American consumers and the U.S. economy. In turn, that will enable a host of new advanced services, such as healthcare applications, high definition video streaming to smartphones, smart cities and grids, the Internet of Things, and so on – that is, assuming regulations enable and encourage the timely deployment of these consumer technologies and services.¹

This inaugural Lost Economy™ report estimates the additional economic benefits of investing and building a 5G network to generate \$533 billion in gross domestic product (GDP). Although this estimate does not include any of the economic benefits from operating and providing 5G services to consumers going forward, we estimate \$1.2 trillion in long-run consumer benefits from these broadband wireless services.

While the economic and consumer benefits of investment and services appear impressive, this report cites a number of local government obstacles affecting investors, such as the imposition of onerous rules, delays in approval, deployment moratoria, and the imposition of high fees – effectively impeding private investment and postponing consumer benefits from state-of-the-art wireless services. Our research finds that states and cities that take steps to streamline regulations and encourage deployment will speed massive benefits to consumers and the economy.

EXPLOSIVE BROADBAND WIRELESS DEMAND

In 2016, there were approximately 400 million wireless subscriber connections – a major milestone considering that the industry has only been around for about 35 years. Along with the growth in subscribership, data traffic per subscriber is expected to be robust, reflecting the surging demand for mobile broadband services. Mobile users benefit from a wide range of applications – from online shopping, banking, streaming video and music, entertainment and gaming to GPS and tracking, communications and social media, and many other services. Since 2010 alone, wireless network data traffic has increased 35 times.²

While data requirements for consumers soar, so will the millions of interconnected devices that will enable the creation of the Internet-of-Things, including machine-to-machine applications, self-driving vehicles, intelligent transportation systems, smart grids, health and public safety initiatives, smart cities, smart homes, virtual reality devices, and even Internet applications for home appliances. Studies find that smart grids could produce \$1.8 trillion in savings over seven years, while self-driving cars and connected devices for health applications could produce annual economic benefits of \$447 billion and \$305 billion, respectively.³ According to Cisco, the number of Internet connected devices will increase three-fold by 2021.⁴

Fulfilling this explosive consumer demand requires faster and better services, which means more wireless spectrum and deploying the next generation of wireless infrastructure based on 5G technology. Transitioning to this technology requires network operators to shift from deploying a few large wireless towers scattered across a service area to a mesh network of many small cells and micro towers that could reach well into neighborhoods.

IMPEDIMENTS TO DEPLOYMENT

Costs are a major factor in making sound investment decisions, and this is certainly the case when it comes to building out the next generation wireless network. Going from today's network of 200,000 cell sites to a 5G network of a million small cells and distributive antenna systems (DAS), wireless providers already face substantial financial risk. According to a study by Accenture, the rollout of 5G services will take seven years and cost an estimated \$275 billion in direct investment by wireless service providers.⁵

With 50 states, 3,000 counties and 20,000 incorporated places, upgrading the nation's wireless infrastructure can be a daunting task involving planning, engineering, construction, and operations – all contingent upon getting approvals of applications and permits from state and local governments.⁶ While the former is under the total control of wireless providers, the latter is not, and it can be fraught with additional costs and requirements, jurisdictional differences and unanticipated delays – all of which will affect the efficiency, timeliness, and cost of service deployment.

Indeed, regulatory costs and uncertainty pose a substantial impediment in investment decision-making. Market choices regarding where and how much to invest have been a staple of economic and financial textbooks for a long time. The decision to invest is affected by uncertainty, which is influenced by regulatory changes that cannot reasonably be forecasted or estimated today.

The risks to 5G deployment are obvious. Because capital expenditures on plant and equipment have long lives, their value rests entirely on the present value of future cash flows. These cash flows are dependent and influenced by future regulatory changes, which can add, delay or create ambiguity, take away opportunities

of value, lack transparency, lead to rent-seeking and gaming, and others risks.

State and local regulations that levy excessive fees for permits and applications, impose rights-of-way (ROW) and pole attachment restrictions, enact discriminatory zoning rules, and delay government approvals all raise the risk and cost of 5G deployment. The result from these regulations means less investment, less economic output, fewer jobs, lost consumer welfare, and reduced levels of innovation. Essentially, consumers will pay more for less.

In some cases, state and local governments have imposed lengthy delays to the approval of wireless applications and permits for antennas, despite the FCC's 2009 imposition of a "shot clock" rules designed to speed state and local approval processes.⁷ In effect, many local governments and agencies have found ways to circumvent the shot clock rules, seeking excessive fees as an easy means to raise additional municipal revenues.

The list of impediments is long. Many government localities have required expert studies, levied environmental assessment fees, imposed spatial and distance restrictions, reviewed similar applications in sequential order rather than in batches, imposed procurement and aesthetic requirements, and discriminated against wireless providers for similar

The FCC has also cited this figure in "Accelerating Wireless Broadband Deployment by Removing Barriers to Infrastructure Investment," FCC, Notice of Proposed Rulemaking and Notice of Inquiry, WT Docket No. 17-79, April 20, 2017, at http://transition.fcc.gov/Daily_Releases/Daily_Business/2017/db0421/FCC-17-38A1.pdf.

⁶ Two-thirds of the U.S. population live in incorporated places, according to the U.S. Census at <https://www.census.gov/content/dam/Census/library/publications/2015/demo/p25-1142.pdf>.

⁷ "2009 Shot Clock Declaratory Ruling," 24 FCC Rcd at 14009.

land requirements provided to others. In some cases, municipalities have imposed moratoria, effectively blocking investments and service upgrades.⁸ For example, one city set a \$30,000 application fee for each utility pole and another locality imposed a \$45,000 fee regardless of the amount of ROW use.⁹

The FCC has reopened the issue this year in a Notice of Rulemaking seeking to accelerate wireless broadband investment.¹⁰ In that notice, they cited examples where the imposition of government fees required to site a tower, including rental and application charges, have exceeded the cost of erecting the tower.¹¹ All of these costs deter deployment and consumer adoption, and these costs flow through to consumers in the form of higher prices. Effectively, this represents progress denied; it is The Lost Economy™.

ECONOMIC BENEFITS FROM INVESTMENT

As noted earlier, the Accenture study estimated the nationwide investment cost for deploying 5G services to be \$275 billion over the next 7 years, consisting of 34% construction costs and 66% engineering and equipment. Using economic state-level multipliers from the U.S. Bureau of Economic Analysis, the increase in gross state product, state employment earnings, and state jobs can be estimated based on the \$275 billion investment can be estimated.¹² Over the 7-year period of construction, the investment is estimated to yield \$533 billion in economic output or GDP, and payout \$163 billion in employment earnings.¹³ The investment in 5G will also create 3 million “worker years” or 435,000

jobs for the next 7 years. These benefits are listed by state in **Appendix I**.

Keep in mind, these economic output and job estimates reflect only the benefits from investment needed to build and deploy 5G services nationwide, and do not include the ongoing benefits once the network is operational, which could be substantial and is not estimated here. As cited earlier, several studies have explored the potential benefits from the adoption of new and innovative services, such as the implementation of smart grids, health applications and other programs – estimated in the trillions of dollars.¹⁴

In addition, as a first approximation, the consumer welfare for broadband wireless services can be estimated. Several academic studies have found the value of wireless spectrum auctions to yield roughly ten to twenty times the value of long-term consumer

¹¹ Ibid, p. 16.

¹² Multipliers for nonresidential structures and electronic equipment (which includes wireless equipment) were weighted by state and component. These multiplier effects measure direct, indirect and induced benefits, and they come directly from the Bureau of Economic Analysis. A full explanation of what multipliers are, standard methodology employed, and sources of data used, see <http://thelosteconomy.com/wp-content/uploads/2017/07/The-Lost-Economy-Final.pdf>.

¹³ The gross product estimate calculated here is slightly higher than Accenture’s estimate of \$500 billion.

¹⁴ See fn. 3 for 5G benefits associated with healthcare, transportation and smart grids.

welfare.¹⁵ Adding up the history of wireless auction revenues, converting these values into 2017 constant dollars, and grossing these values up by a factor of ten provides an approximation of the long run consumer welfare for broadband wireless services – equal to roughly \$1.2 trillion. Using state-level subscribership, we apportion these benefits to each state as shown in **Appendix II**. Keep in mind, these estimates do not include the billions of dollars in additional spectrum to be auctioned off in the next few years to deliver even faster consumer services, including 3.85 GHz of spectrum approved for auction under the FCC’s Spectrum Frontiers Order, pending Congressional legislation, and a proposal that would free up as much as 15 gigahertz (GHz) over the next several years.¹⁶

SPEEDING DEPLOYMENT

Many states have already begun reevaluating rules designed to encourage wireless broadband investment, recognizing that states with a favorable regulatory environment will likely be the first targets for investment and, in turn, will be the first to see significant economic and consumer benefits. Still, other states are still far behind in terms of reforms. Without improvements, these state and local areas are likely to see less investment and will not get the full measure of benefits noted in this report.

There are some ways that state and local regulations can be streamlined in order to maximize the consumer benefits of 5G technologies and services. For example, government applications for siting, use of

municipal poles, and ROW should be subject to a short shot clock covering the entire review process, instead of delays or moratoria on small cell investment. Batches of applications with similar facilities and equipment should be considered at once, instead of sequentially. Wireless providers should not be discriminated against for their access to similar land use requirements, compared to other industries. In addition, states and local government should not impose procurement and logistic requirements on wireless contractors and providers; and they should not place spatial and distance restrictions on facility placement or require subjective aesthetic requirements on small cells, DAS systems, and other 5G facilities.

While some states are moving ahead with reforms, other states need to follow suit in the interest of wireless consumers. Once these regulations are streamlined, it will result in significant private investments that will spur economic growth, create jobs and increase consumer welfare. That result is in the public’s interest.

This Lost Economy™ report provides estimates of the immense scale of benefits derived from 5G deployment, but these opportunities can only be realized if applications and permits are reviewed and evaluated in an efficient, effective, low cost and timely manner. Absent policy action aimed at constructive reforms to the regulatory processes, there is substantial risk that economic progress and opportunity will be denied for millions of American citizens and workers.

APPENDIX I

7-YEAR ECONOMIC IMPACT FROM 5G INVESTMENT: Top Ten States with Highest 5G Investment

(Billions of Current Dollars and Annual Jobs Required)

California

Investment: \$34.59
GDP Effect: \$68.91
Earnings: \$21.95
Jobs: 51,706

Texas

Investment: \$23.44
GDP Effect: \$51.31
Earnings: \$15.88
Jobs: 39,369

New York

Investment: \$19.02
GDP Effect: \$33.03
Earnings: \$9.81
Jobs: 22,738

Florida

Investment: \$17.28
GDP Effect: \$32.77
Earnings: \$10.36
Jobs: 31,202

Illinois

Investment: \$11.33
GDP Effect: \$24.56
Earnings: \$7.35
Jobs: 18,634

Pennsylvania

Investment: \$10.85
GDP Effect: \$22.80
Earnings: \$6.65
Jobs: 17,541

Ohio

Investment: \$9.96
GDP Effect: \$20.82
Earnings: \$6.29
Jobs: 18,063

Michigan

Investment: \$8.48
GDP Effect: \$16.83
Earnings: \$5.08
Jobs: 15,062

New Jersey

Investment: \$8.09
GDP Effect: \$15.78
Earnings: \$4.54
Jobs: 11,150

North Carolina

Investment: \$8.08
GDP Effect: \$16.35
Earnings: \$5.20
Jobs: 14,801

APPENDIX I (continued)

7-YEAR ECONOMIC IMPACT FROM 5G INVESTMENT

(Billions of Current Dollars and Annual Jobs Required)

	INVESTMENT	GDP EFFECT	EARNINGS	JOBS*
Alabama	\$4.02	\$7.56	\$2.26	7,067
Alaska	\$0.56	\$0.89	\$0.35	894
